Conclusion

# Why this workshop?

- In the social sciences few attention to what tools to use (and why)
- LATEX is very much used in the scientific world and works brilliantly together with
  - statistical packages, such as Stata and R,
  - markdown/HTML,
  - · reference managers.
- · Why / want to give this workshop
  - · intrinsic interest
  - · my goal: pre-conferences workshops / courses

# What I want (and don't want) with this workshop

- Give a general introduction of why some tools work together
  - LATEX
  - · reference managers
  - (statistical) output
- Give an introduction to LATEX
  - First the basics + using references
  - Next workshop: some advanced stuff
- What I do not want
  - Tell you what applications to use (you need to decide and make a well-informed decision)

Conclusion

# **Background**

- T<sub>E</sub>X has been devised by Donald E. Knuth in the late 70's
- LATEX is a set of macro's around TeX and devised in the 80's
- LATEX is a typesetting program, not a Word processor
  - It is actually some code that needs to be compiled
  - Code is typed in by an editor
- So,
  - Huge differences between Word and LATEX
  - for LATEX you need an editor:
    - Specific editors: TexStudio, TexShop, RStudio
    - General editors: Sublime, TextMate, Atom, Vim, Emacs

Paper structure

Formula's

Figure:

\_ . . .

Conclusion

# **Disadvantages**

- Not WYSIWYG
- You nead to learn (quite) some commands
  - Learning curve, but
  - hurray for cheat sheets and Google
- Difficult to cooperate with people from the dark side
- Basic LateX has difficulties with incorporating new fonts (Hoefler, minion pro)
  - XeTeX
  - For the purists: LATEX does it right (LATEX vs Word)
- · Difficult to create unstructured and ugly documents

# **Advantages**

- Free (as in beer) and ubiquitous
- WYSIWYM
- Consistent lay-out throughout the whole document (including tables, appendices, formulas, source code, etc)
- Internal references are a breeze (references, ToC, ToT ...)
- Forced to structure documents
- Macros, thus scriptable
- Large community, thus a package for almost everything (books, articles, presentation, posters, exams, musicscores)
- Superior typography & output
- Many free LATEX templates

Conclusion

Conclusion

# LATEX versus Markdown

- Markdown (all variants): lightweight markup language that can export to .doc, .html, and .pdf.
- Much easier then LATEX but less flexible
- Used by writers/blogs even for complete websites
- But good interaction with LATEX; if not only for formula's

Referencing

Conclusion

# How does LATEX work in practice?

- You edit a .tex file without thinking about how it looks
  - distraction free writing (yeah right)
- You then compile it
  - LATEX is unforgiving: if there is an error, usually it does not compile
  - Typically, errors are missing brackets or parentheses.
- Typically, source .tex file is compiled into .pdf

# Code, documentation and output

- Synonyms
- 2 All based on .txt files
- 3 Encompasses almost anything
  - data itself (.csv, .txt)
  - set of commands for data cleaning and statistical analysis (.do, .R)
  - database with references (.bib)
  - text for articles, presentations or websites (.tex, .html)
- Only output is displayed/interpreted differently (e.g., in a browser or pdf viewer)

Conclusion

Nevt time

# Folder structure of your new project (theses, paper, assignment & research)

- Think a priori about project set-up
  - Seperate analysis, data and output files
- Be careful with source data!
  - · Seperate source and derived data files
  - Typically
    - · you get/collect data
    - · transform data
    - · analyse data
  - · Keep track of all these stages!
